K-Tape®... Always a Step Ahead

K-Tape is an innovative product, recognized worldwide for its optimum quality and performance. The Kumbrink developed original K-Tape combines the best natural, raw materials with the most advanced manufacturing process available.

- Elastic cotton tape for professional use
- Water resistant
- Sweat-permeable & breathable
- Medication free
- No active ingredients
- Physiobond acrylic glue
- 96% cotton, 4% spandex

K-Tape and Crosstape are certified medical products that meet the requirements of MDR 2017/745

The new European medical product regulations that took effect on May 26, 2021, replace all heretofore existing regulations, and have thereby become legal requirements in every member country of the EU. This means that all medical products in use and for sale in Europe must be freshly certified in line with these regulations. Products that do not meet the requirements are banned from medical and therapeutic use.

As producers of K-Tape and Crosstape products, we have always ensured that our products meet the rules that regulate medical products, and have deployed the best possible standards in regard to quality of raw materials and production processes. This applies to MDR 2017/745 as well.

Our K-Tape and Crosstape product series meets the new requirements and is certified according to the new guide lines.

K-Tape and Crosstape are listed in EUDAMED, the new European databank, thereby acquiring the necessary UDI-DI – the UDI Device Identification number, which in place of the usual EAN-scan code on the packaging, automatically provides the product's LOT number and expiry date.

For your purposes in a hospital, rehabilitation centre, or medical practice this means that K-Tape and Crosstape are not only high-quality products but also meet the MDR 2017/745 requirements.

We are available to answer any questions you might have about our products.

High-End Quality

The Cotton

Only high-quality cotton from one supplier is used for K-Tape. This quality guarantees a fabric structure with homogeneous thread density and virtually knot-free manufacture.

The Elastic Thread

If a thread loses its elasticity, the therapeutic effect is lost. This is why we use the best quality elastane thread for K-Tape. This ensures consistent elasticity levels throughout the entire period of use.

The Dyes

You need to be certain that dyes and adhesive do not harbor risks to the skin or health when applying a tape adhering to the skin for up to 7 days. We use high-quality dyes for K-Tape, supplied by Dystar. The reason: Dystar products possess the *OEKO-TEX Standard 100 label* and are safety approved for use in baby clothing. K-Tape is suitable for a variety of applications and a wide range of users.

The Cut

Quite simply, it is the cut that ultimately demonstrates the outstanding quality of K-Tape.

A clean, straight cut not only looks professional, it also guarantees better adhesion and duration of wear. If the threads are torn by an unclean cut or if a skewed position causes the outer threads to be frequently cut, the tape unravels at a faster rate and loses its adhesiveness. We therefore take time in production, following a meticulous approach and using high-quality tools, to produce the best cut K-Tape possible.

The Physiobond® Adhesive

Only K-Tape is equipped with professional grade Physiobond adhesive. Physiobond is a registered trademark in Europe and the USA and is used exclusively for K-Tape. We recognize the quality of an adhesive depends not only on the choice of raw materials, but also in the manufacturing and finishing processes.

The objective during production is to create long polymer chains enabling the adhesive to anchor effectively onto the skin. This is followed by a complex temperature-time procedure to remove skin-irritating residual monomers. It is only then, that you can create a first-class tape that establishes a new standard.

The Backing Paper

Typically, backing paper is only there to protect the adhesive coating. However, with K-Tape, the backing paper has additional practical functions as well.

Paper Fibers

The correct orientation of paper fibers makes the backing paper more stable and K-Tape pre-cuts deform significantly less than those with conventional backing paper.

Prestretch

It is necessary to prestretch the cotton fabric during production to ensure crease-free manufacturing. It's an important production procedure we use for quality assurance.

K-Tape is applied to the backing paper with 10% prestretch, automatically giving it the ideal amount of prestretch for muscle technique taping. By using the correct technique to apply the tape, it is possible to transfer the required amount of prestretch to the skin. This enables K-Tape to always be pulled off the backing paper with the same amount of tension. Its handling always feels the same... every time you use it.

Benefits for Therapist and Physician

Patients receive a high-quality product, recognized worldwide for its performance quality. Skin irritation is nearly non-existent, which means no patient complaints. Its natural materials contain no harmful substances whatsoever.

K-Tape may potentially adhere to the skin for one week. Many inexpensive tape substitutes adhere for just 2 to 3 days, meaning that they have to be changed frequently. Since patients usually have to pay for all treatments themselves, frequent renewal means higher costs for both patient and therapist.
